

# Scrum

---

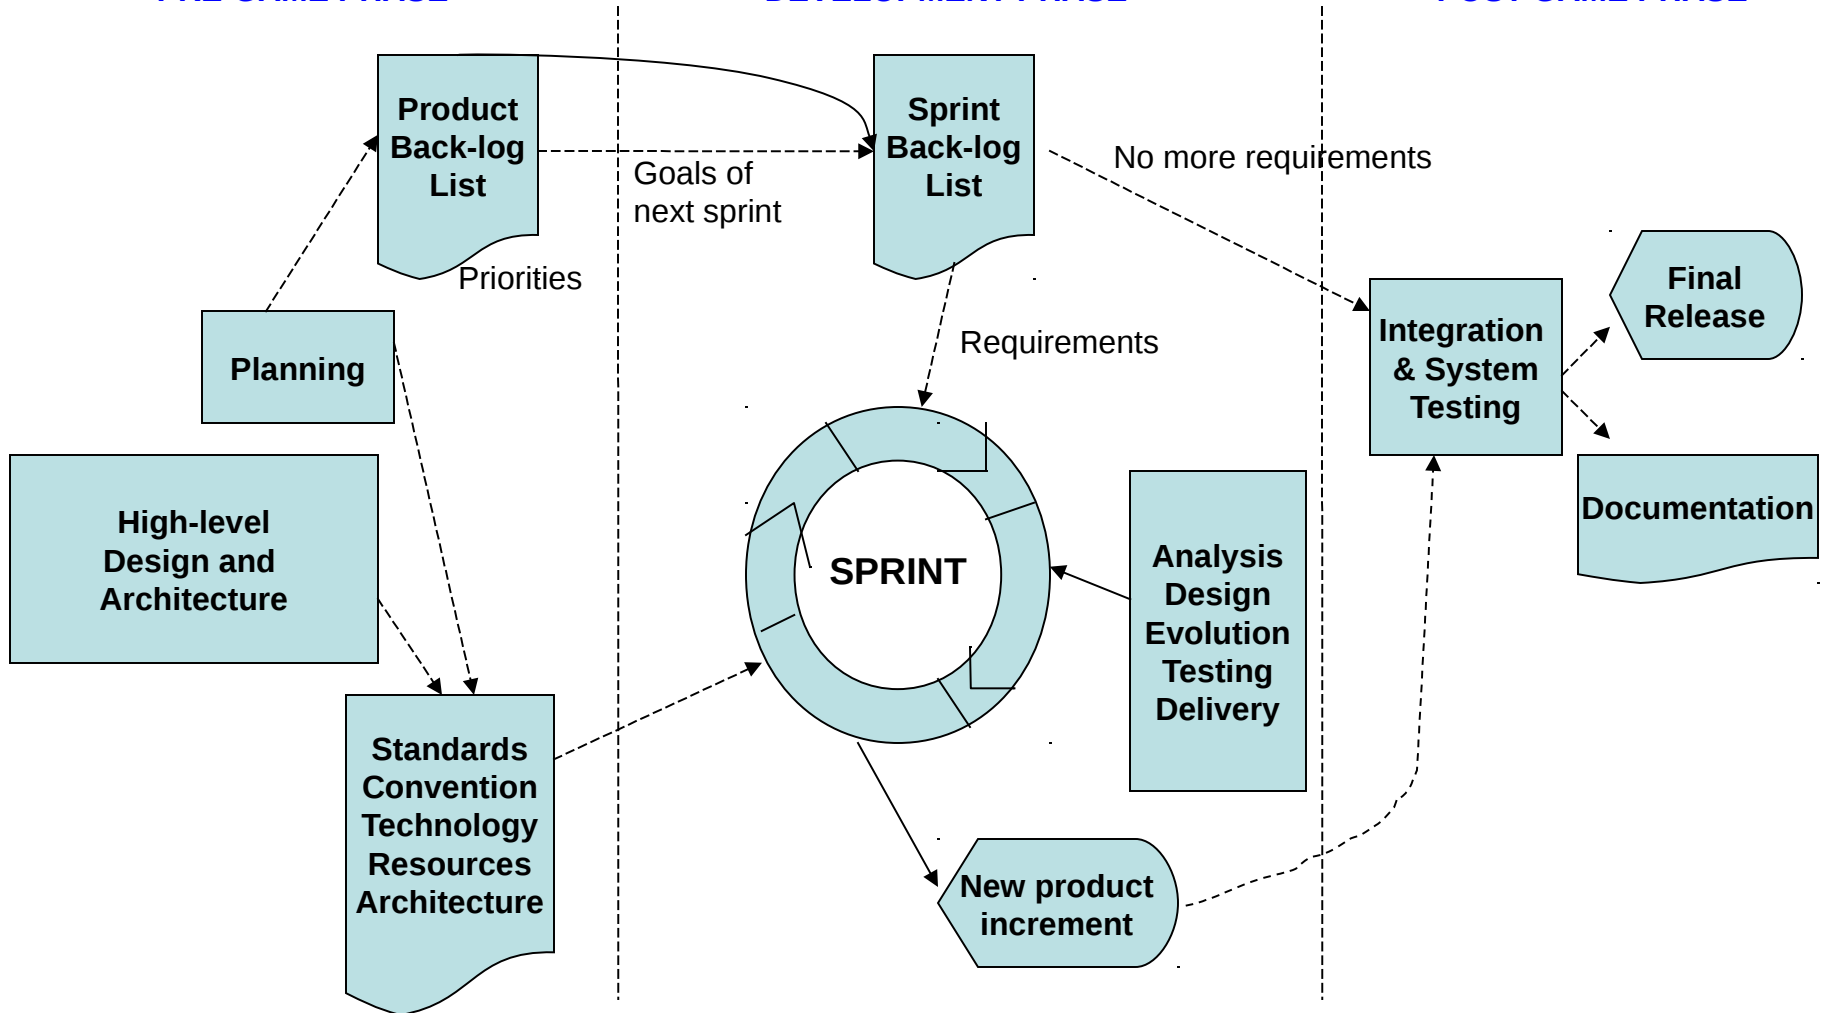

- Scrum is an adaptive, quick, self-organizing system development process that originated in Japan.
- Does not define any specific software development techniques for implementation phase.
- Instead concentrates on how team members need to adapt to constantly changing environment.

# Scrum

## PRE-GAME PHASE

## DEVELOPMENT PHASE

## POST-GAME PHASE

# Scrum: Phases

---

- Scrum process includes three phases:
  - Pre-game
  - Development
  - Post-game
- Pre-game phase includes two sub-phases:
  - Planning: Apart from usual artifacts, one specific output that is created is a product back-log that contains all known requirements.
  - Architecture/High-level design

# Scrum: Phases

---

- Development phase is the agile part of Scrum.
- The system is developed in **sprints**, each lasting from one week to one month.
- Sprints are iterative cycles where the functionality is developed or enhanced to produce new increments.
- Each sprint includes most of the traditional phases of software development.
- The architecture and design of the overall system evolves during the sprint development.

# Scrum: Phases

---

- The post-game phase contains the closure of the release.
- The system is ready for release.
- Typically integration testing, system testing and documentation are done in this phase, before release.

# Scrum: Roles and responsibilities

---

- Scrum master
- Product owner
- Scrum team
- User
- Manager
- Customer
